Designing a Coherent Framework for the Regulation of Internet Content

Mira Burri

Abstract

Against the backdrop of transforming patterns of content production, dissemination and use, as well as the changed governance landscape in the Internet age, this paper seeks to emphasize the point that media can no longer be taken as a self-contained policy domain reserved for the nation state. It raises awareness of the necessity for a broader understanding of the relevant societal and governance processes and sketches the new challenge to ensure a coherent regulatory framework for Internet content. In this sense, the paper seeks to address the question of appropriate forms of regulating Internet content and pleads for a recalibrated action in the domain of global media law and policy, in particular with regard to network neutrality and Internet filtering.
Designing a Coherent Framework for the Regulation of Internet Content

Mira Burri

About the Author
Mira Burri is a senior fellow and a lecturer at the World Trade Institute, University of Bern, Switzerland. She leads a project on digital technologies and trade governance and teaches courses in international media, intellectual property and trade law. Mira has published extensively in the fields of global trade, media and Internet law and policy. She has most recently co-edited the publication Trade Governance in the Digital Age (Cambridge University Press 2012) and authored Public Service Broadcasting 3.0: Legal Design for the Digital Present (Routledge 2015). Mira consults governments, international and non-governmental organizations on cultural diversity, as well as on innovation and digital trade matters. Mira’s publications are available at: http://ssrn.com/author=483457

Acknowledgements
I would like to thank the excellent team of The Hague Institute for Global Justice and in particular Sash Jayawardane, Eamon Aloyo and Joris Larik. I am also indebted to the participants in the Global Governance Reform Initiative for the inspiring discussions and the valuable feedback. The comments of the two anonymous reviewers were very useful for improving the paper. All errors remain my own.

About The Hague Institute for Global Justice
The Hague Institute for Global Justice is an independent, nonpartisan institution established to undertake interdisciplinary policy-relevant research, develop practitioner tools, and convene experts and policymakers to facilitate knowledge sharing. Through this work the Institute aims to contribute to, and further strengthen, the global framework for preventing and resolving conflict and promoting international peace.

About The Hague Institute Working Paper Series
The aim of the Hague Institute working papers series is to provide an outlet for authors to make original, rigorous, and policy-relevant research available publicly. Each Hague Institute working paper is peer-reviewed by at least two experts, one internal to and one external to the Hague Institute.

The views expressed in this paper are solely those of the author(s) and do not necessarily reflect the views of The Hague Institute for Global Justice, any other individual, or any other organization.
The regulation of content: Introductory remarks

The regulation of content, understood here as a term encompassing film, video, audio and television - or “audiovisual services” in the parlance of the World Trade Organization (WTO), 1 - used to be entrusted to national media law and policy. A number of concerns have traditionally motivated state intervention, related to the specific nature of the media and media markets and to the specific function that they are entrusted to play in society. Next to various public interest concerns, such as those regarding children and other “vulnerable” individuals, 2 the fundamental role of the media has been to sustain the freedom of expression – in both its passive and active dimensions. Thus, in the West European tradition, the media has been given a particular structural function and is meant to contribute to a vibrant public sphere with diversity of ideas and viewpoints. 3

Reflecting these rationales of public interest intervention in the media space, states have, over the years, developed different toolkits for regulating content. Some of the instruments in this toolbox have been structural (directed at the structure of media organizations and markets) such as media ownership regulation; others have been behavioural (directed at the behaviour of media outlets) such as restrictions on violence, sexuality and adult language, as well as positive prescriptions for certain types of content with different culture-specific paternalistic nuances. 4

The present paper does not question these public interest rationales; rather it argues that in the contemporary media environment it has become essential to recalibrate content regulation – on the one hand, so as to take into account the changing methods for creating, distributing and accessing content associated with the Internet; on the other hand, so as to reflect the changed governance landscape.

As a starting point for this call for a policy update, it should not be forgotten that media regulation originated from a particular time period. That was a time marked by analogue communications, spectrum scarcity, high-entry costs and very few media outlets – all conditions that have now been changed. An essential characteristic of this “older” system to be borne in mind is that it permitted centralized oversight and control through a single point of entry. This control was the prerogative of the state. It was embedded in the democratic mechanisms of the nation state and secured through a complex network of institutions, which balanced the free flow of information against the protection of other essential values and interests – such as privacy, national security and public order. 5

---

1 The WTO Services Sectoral Classification List (Doc.MTN.GNS/W/120, 1991) includes under the sector “audiovisual services” the sub-sectors: motion picture and video tape production and distribution services; motion picture projection services; radio and television services; radio and television transmission services; sound recording and others.
2 For a full taxonomy, see e.g. Terry Flew, “New Media Policies,” in Managing Media Work, ed. Mark Deuze (London: Sage, 2011), 63.
3 See Nicholas Garnham, “Public Service versus the Market,” Screen 24 (1983): 6–27. In the US, while the system is profoundly different than in Europe and it has been the concept of the “marketplace the ideas,” rather than the Habermasian “public sphere” that motivate state intervention, the US Supreme Court has long identified speech diversity as a “basic tenet of national communications policy” and stressed that “the widest possible dissemination of information from diverse and antagonistic sources is essential to the welfare of the public.” See Turner Broad. Sys., Inc. v. FCC, 512 U.S. 622, 663–664 (1994) (quoting United States v. Midwest Video Corp., 406 U.S. 649, 668 n. 27 (1072)) (quoting Associated Press v. United States, 326 U.S. 1, 20 (1945)).
It is also important to stress from the outset that the international regimes related to content, as formulated during the analogue/offline age, were nominal. They included, on the one hand, soft law under the United Nations Educational, Scientific and Cultural Organization (UNESCO) that endorsed some cultural rights and freedoms as well as the sovereign right of states to define their content policies. On the other hand, we had the “harder” rules on economic globalization epitomized by the Agreements under the World Trade Organization (WTO) which, while liberalizing trade in goods and services, carved out policy space for the nation state to regulate on essentially all aspects of content. While international human rights law addresses important aspects of content regulation, the margin of appreciation given to states to formulate their policies according to national specificities has been large, save in cases of clear individual rights’ violation - and even then this only applies to the European region, where the European Court of Human Rights (ECtHR) has been equipped with more power and enforceability of its decisions. The important exception of this absence of international harmonization was in the field of intellectual property (IP) protection with the WTO Agreement on Trade-related Intellectual Property Rights (TRIPS) and the suite of treaties under the framework of the World Intellectual Property Organization (WIPO). However, these rules were only of marginal importance to the regulation of content and have been rarely (perhaps wrongfully so) considered in content governance strategies.

While the role of these major international organizations is still critical, it is also evident that the global governance landscape has been profoundly changed in the last two to three decades with the emergence of a great number of new actors on the international scene and international regime complexes that address a set of topics in a non-hierarchical and often contentious manner. The global governance of the Internet can be said to be a vivid illustration of these developments that engage not only states and international organizations as classic subjects of international law but also many multi-stakeholder forums that create soft, or even informal, law.

Against this backdrop, the paper seeks to emphasize the evident point that media can no longer be taken as a self-contained policy domain reserved for the nation state and there is a need for a broader understanding of the relevant societal and governance processes. Many other domains have now become relevant, in more or less immediate ways. The linkages have only grown stronger as media consumption has moved from old to new media and the Internet has become deeply integrated in everyday economic, political, cultural and social life. This has triggered a new challenge for regulators striving to ensure a coherent regulatory framework for Internet content.

Alongside the usual difficulties for regulators grappling with new technologies, the governance challenge here stems from the often strikingly different regulatory histories,

---

8 See e.g. Graham Dutfield and Uma Suthersanen, Global Intellectual Property Law (Cheltenham: Edward Elgar, 2008).
rationales for intervention and institutional structures of the previously separated policy domains. This renders it extremely complex to achieve regulatory design appropriate for the achievement of core public policy objectives. A related phenomenon that can be observed is the growing “messiness” of regulation, as it not only draws together horizontally different domains but is also unevenly vertically spread along a multi-layered structure that mobilizes various actors at the local, national, regional and international levels.

This paper seeks to address the question of appropriate forms of regulating Internet content, at least from a bird’s eye view, and sketches a few salient issues that call for recalibrated action in the domain of global media law and policy.

**Enter the web: Features of the new media landscape**

Although television is still the number one media outlet for the average citizen on this globe, very few would dispute that the media landscape has been utterly transformed by the Internet. While the effects are not equally distributed across nations, generations and classes, the patterns of media use have been profoundly modified. Overall, we are faced with a decidedly different information and communication environment.

As broader lines of change, one can identify the following features of the new media space:

1. **Unlimited “shelf-space”, abundance of content and its different organization.** In the digital space, the notion of scarcity has been modified and rendered virtually obsolete. Blogs, social networking sites, virtual worlds and many other forms of information and communication made available over the Internet have proliferated and turned into viable media outlets. These co-exist next to traditional ones, offering a new way of accessing information and/or entirely new information. The sheer amount of information that is available at all times from any point connected to the Internet is simply mind-blowing. There is, indeed, scarcity of attention. What is also worth noting - and is often forgotten when describing the new digital media space - is the different way information is organized in it. The fact that any type of data can be expressed in digital format has completely changed the rules for organizing libraries, alphabetical order for name registers and genre categories in CD shops, the digital environment enables an encompassing, dynamic and interlinked information archive that can be searched through a single entry point according to unlimited criteria.

2. **New ways of distributing, accessing and consuming content.** Enabled through multiple devices over the almost ubiquitous Internet, the patterns of handling information have changed. Instantaneous distribution to millions of people, pulling content instead of

---

passively receiving it, simultaneous consumption from many sources are but few of the (distinct from TV) features of contemporary online communication. Naturally, these have serious repercussions for users, businesses and for the entire market for information goods and services. They have also changed the transparency of cultural symbols and the way they circulate in global and local contexts.\textsuperscript{17}

3. \textit{New modes of content production, where the user is not merely a consumer but also an active creator.} Reduced thresholds to participation, as well as the (ever greater) affordances of digital technologies, have allowed individuals and groups of individuals to create new content and to play around and remix existing content.\textsuperscript{18} This type of creativity, interactivity and co-operation is unique to digital media and is a radical departure from the conventional image of massive and passive audiences, only slightly empowered by their TV remote-controls.

One may reasonably wonder whether these, often truly transformative, changes of the media environment have inspired changes in the media policy toolkit too. Surprisingly, the answer to this question is negative: indeed, national media law and policy have only slightly and not very innovatively adjusted to the opportunities afforded by the Internet and the societal implications brought about with them.\textsuperscript{19} Neither has there been a conclusive and evidence-based analysis of the economic, cultural, social and political repercussions of the new modes of content creation, distribution, access and consumption. In this regard, we are still unsure whether the Internet and the changes it triggers contribute to the intrinsic media policy objectives, such as pluralism of ideas and opinions, or actually obstruct their attainment.

After the original strong beliefs in the naturally generated diversity (also known as the “long tail” theory\textsuperscript{20}) and in the democratizing power of the Internet,\textsuperscript{21} current practices seem to be much more nuanced. As for the long tail, as Napoli summarizes: “it does indeed seem to be unclear at this point whether a media environment of unprecedented choice and sophisticated tools for identifying and accessing relevant content genuinely helps or hurts the prospects for content that has not traditionally resided in the ‘head’.\textsuperscript{22} As global media corporations merge, both horizontally and vertically, in the pursuit of better utilization of all available channels and platforms, diversity may in fact be lost. While the positivism for user creativity is still strong and its long-term effects on legal modeling may be far-reaching,\textsuperscript{23} in the narrower sense of grassroots content production and its impact on democratic discourse, sceptics have stressed the dangers of fragmentation of the public discourse.\textsuperscript{24} The question of

\textsuperscript{17} Benkler, The Wealth of Networks
diversity exposure, especially in automated content generation spaces, is also vexed, as it appears that citizens' real consumption remains limited to a handful of mainstream online sources that are, as a rule, professionally produced by white, educated males.

It is in this sense essential that a more careful, finer-grained assessment emerges and research has a critical role to play in this regard. Policy adaptation needs to be evidence-driven as it may be that in some cases, digital media hint at opportunities for better, more efficient and flexible accommodation of public policy goals. However in other cases, they may equally be viewed as challenges, perhaps calling for additional regulatory intervention. To be sure, this adaptation, whatever its direction and form, is likely to unfold in national regulatory domains.

Despite this, the point this paper seeks to make is that content regulation under the conditions of the ubiquitous Internet can no longer be confined to national media law and policy and one needs to contemplate a design that reflects and matches global arrangements. This is because, due to digitization and the convergence of the media, telecommunications and the Information Technology (IT) sectors, one ought to consider all layers of the communications model.

In this sense, the content layer cannot be viewed in isolation, as very often regulatory decisions taken at the physical or logical layers matter for content. In addition, it should be underscored that digital technologies have had profound impact on governance forms, which depart from the conventional notion of law and shift towards more complex, heterogeneous and uncoordinated mechanisms. One area that seems particularly important is the increasingly critical role of technology as a means of control, existing on top of law or beyond law’s scope. It is important to raise awareness of these new tools of content control and understand how they operate, so as to be able to recognize the barriers to the free flow of information and find ways to tackle them. To support these arguments, we examine in turn two specific cases: net neutrality and Internet filtering.

**Net neutrality**

**A brief introduction**

The neutrality principle has been intrinsic to the functioning of the Internet. In essence it holds that the network should be neutral to the content being passed through it and that the intelligence is located at the edges of the network. The best-effort Internet has thus not discriminated between a video game, a live-streamed football match or peer-to-peer music.
downloads – it has simply treated them as bits of data flowing over the network that need to be assembled at their destination. Of course, over the years and as earlier mentioned, the amount of data has exponentially increased – due to the increased opportunities afforded by technology as well as the emergence of exciting new services like YouTube, Whatsapp, and other applications offered “over-the-top” of the network. The behaviour of the users has changed and migrated towards more real-time data consumption, in particular video. The demands on the network have accordingly increased.

On the one hand, this has led to some innovation, such as the emergence of content delivery networks (CDNs). CDNs, like Akamai, Level 3 and Limelight, are paid by big content providers - such as Google, Netflix, Hulu or the BBC - to improve the quality of experience in a best-effort Internet. They achieve this by building additional infrastructure that bypasses congested routes on the public Internet and by caching frequently downloaded content closer to respective customer access networks.

On the other hand (and despite CDNs), strong dependence on network remains and broadband and wireless access providers have the potential to act as gatekeepers for digital content distribution. There have been cases where Internet Service Providers (ISPs) have abused their power and exercised discriminatory control over the flow of information delivered over their network. This is clear evidence as to the existing interdependence between the infrastructure and the content layers; to the precarious balance between them and to the perils of spillovers of dominance.

The arguments underlying the network neutrality debate go much beyond mere traffic management and possible anti-competitive behaviour. The net neutrality proponents argue that this is a basic design principle of the Internet that facilitates innovation at the edges of the network and assures the free flow of information. “The idea is that a maximally useful public information network aspires to treat all content, sites, and platforms equally. This allows the network to carry every form of information and support every kind of application.” A number of scholars, as well as many Internet providers, have argued to the contrary and against regulation, as there is thriving competition on the market. Yet, overall, there seems

---

33 Between 2008 and 2011 users shifted from a “download now, use later” method of viewing video to on-demand viewing. This shift has caused the peak traffic period, generally 9:00 p.m. to 11:00 p.m. The heaviest 1% of downstream users account for 21.3% of the overall amount of downstream capacity used. Sandvine reports that real-time entertainment is gaining 4–5% percent share of total Internet traffic on North American fixed access networks every six months. Netflix’s share of peak hour downstream traffic was 32.9%, YouTube’s share was 13.8%. See FCC, Annual Assessment of the Status of Competition in the Market for the Delivery of Video Programming, 15th Report, MB Docket No 12-203 (2013), 126–127, referring to Sandvine, Global Internet Phenomena Report, 2012.
35 The Comcast case is perhaps the most widely known, where Comcast was throttling certain content. See Comcast Corp. v. FCC, 600 F.3d 642, 2010.
37 It is true that in many situations the case is not one of black-and-white discrimination, as traffic management is often needed to enhance the efficiency of network utilization and to enhance reliability for critical services. See e.g. Krämer et al., “Net Neutrality: A Progress Report.”
38 See Wu, Net Neutrality: FAQ, in particular the articles by Christopher Yoo; e.g. Christopher Yoo, “Network Neutrality or Internet Innovation?,” Regulation 33 (2010), 22–29.
to be a growing acknowledgment that the principle of network neutrality needs to be safeguarded.

**Net neutrality policies**

A network neutrality principle would avert any possible discrimination on the network, so that all communication passing through would be treated equally regardless of its content, application, service, device, sender or receiver address. In this context, network neutrality rules would prevent Internet providers from blocking, degrading or imposing tolls on unaffiliated providers.

While net neutrality is very present in the debates of OTTs and Internet traffic, as well as broadly speaking in the context of Internet innovation, not all – and in fact very few – countries have fully fledged net neutrality policy packages in place. Some countries have refined the existing rules but rather light-handedly, with changes to the existing regulatory regime governing communications services, but not going so far as to prohibit certain behaviours. The has been the EU’s initial stance, adopting merely some recommendations for EU Member States to take steps to indirectly address net neutrality through measures including: improved transparency in traffic management policies, lowering switching barriers to make it easier for subscribers to switch ISPs and minimum quality of service requirements. Meanwhile, as we explain below, the European Commission has moved towards a more interventionist approach and joined the countries pursuing active reform. Countries such as the United States, France, the Netherlands and Chile have been amongst the more proactive states. The most far-reaching case, briefly discussed next, is that of the US.

**Net neutrality in the US**

On 26 February 2015, after lingering uncertainties and heated debates in policy, industry and academic circles, the US Federal Communications Commission ruled in favour of net neutrality by reclassifying broadband Internet access as a telecommunications service and thus applying Title II (common carrier) of the Communications Act of 1934 to Internet service providers. On 13 April 2015, the FCC published the final rules of its Open Internet Order.

The essential provisions are the following: Blocking, throttling and paid prioritization are forbidden. This is valid for broadband as well as for mobile operators. The Order establishes further that ISPs cannot “unreasonably interfere with or unreasonably disadvantage” the ability of consumers to select, access and use the lawful content, applications, services, or devices of their choosing; or of edge providers to make lawful content, applications, services, or devices available to consumers. The FCC will have authority to address questionable practices on a case-by-case basis. The Order further recognizes the critical role of

---

40 Despite this reclassification, the FCC has sought to adopt a light-touch approach and forbears from certain provisions of the Communications Act that are not in the public interest, such as rate regulation or universal service contributions. FCC, “FCC Adopts Strong, Sustainable Rule to Protect the Open Internet”, FCC News Media Information, 26 February 2015.
41 Federal Communications Commission, Protecting and Promoting the Open Internet, 47 CFR Parts 1, 8, and 20, [GN Docket No. 14–28, FCC 15–24], Federal Register, Vol. 80, No 70, 13 April 2015.
42 No blocking means that broadband providers may not block access to legal content, applications, services, or non-harmful devices.
43 No throttling means that broadband providers may not impair or degrade lawful Internet traffic on the basis of content, applications, services or non-harmful devices.
44 No paid prioritization means that broadband providers may not favour some lawful Internet traffic over other lawful traffic in exchange for consideration of any kind (no “fast lanes”).
transparency. It requires that broadband providers disclose, in a consistent format, promotional rates, fees, surcharges and data caps. Disclosures must also include packet loss as a measure of network performance and provide notice of network management practices that can affect service.

Reasonable network management is still permitted. However, the network practice must be primarily used for and tailored to achieving a legitimate network management – and not business – purpose. For example, a provider cannot cite reasonable network management to justify reneging on its promise to supply a customer with “unlimited” data.

For the first time, the FCC can also address issues that may arise in the exchange of traffic between mass-market broadband providers and other networks and services. The FCC can hear complaints and take appropriate enforcement action if it determines that the interconnection activities of ISPs are not just and reasonable. Overall, this is a very strong policy signal that prioritizes network neutrality and ensures it protection.

Net neutrality in the EU
The net neutrality debate in the European Union has broadly followed the one in the US but has been much more fragmented because of a more complex decision-making process that involves a number of EU institutions and the often different opinions of Member States. After extended political deliberations, the EU reached an agreement on net neutrality on 30 June 2015, the final vote of the EU Parliament was cast in October 2015.

The new EU rules prohibit any blocking, throttling, degradation or discrimination of Internet traffic by Internet service providers and ensure an open Internet, where users are free to access the content of their choice, irrespective of the end-user’s or provider’s location or the location, origin or destination of the service, information or content. This general prohibition is only subject to a limited number of exceptions that include: (i) the need to implement a court order; (ii) the need to preserve the integrity and security of the network; and (iii) to prevent or mitigate the effects of temporary and exceptional network congestion provided that equivalent types of traffic are treated equally.

The EU rules will nonetheless allow the prioritization of some “specialised” services on condition that they do not harm the open Internet access. These are services that require an improvement and/or guarantee of quality, such as IPTV, high-definition video-conferencing or healthcare services like tele-surgery. The EU version of the “open Internet” is also not definitively banning “zero-rating” – i.e. the practice of sponsored connectivity, whereby some providers of Internet access, especially mobile operators, do not charge for the data volume of particular applications or services in limited or metered data plans.

47 Article 23 of the European Parliament legislative resolution, ibid.
48 “Specialised service” means an electronic communications service optimised for specific content, applications or services, or a combination thereof, provided over logically distinct capacity, relying on strict admission control, offering functionality requiring enhanced quality from end to end, and that is not marketed or usable as a substitute for internet access service. Article 2, ibid.
49 The Commission notes that zero rating may be an opportunity for price-sensitive users and encourage them to use digital services. Zero rating however is to be subject to closer monitoring to ensure compliance with the rules.
The EU net neutrality measures are part of an ambitious overhaul of EU telecoms rules, which will come into place in 2016. This reform is part of the Commission’s plan for a Digital Single Market that foresees a new horizontal approach to the digital media space.\textsuperscript{50} It is fair to note that the “two-speed” Internet possibility is still a deviation from the US net neutrality approach and will surely remain a contentious topic – in particularly, in view of the ongoing negotiations of the Transatlantic Trade and Investment Partnership Agreement (TTIP) between the US and the EU.\textsuperscript{51}

In the next section, we look at the possibilities to exert control through technologies that the digital space has permitted.

\textbf{Technologies of control}

\textbf{Internet filtering}

Internet filtering is the most commonly discussed technologically enabled form of control. Although it has existed for quite some time now, it has evolved significantly in terms of its scope and the extent of intervention, targets and methods. It is now the reality that, despite all the talk about the Internet’s ability to “route around” censorship, many governments (not just undemocratic ones) have proven adept at extending state control into cyberspace for a variety of reasons, such as public morality, cultural integrity and political control.\textsuperscript{52}

The manner of exercising control varies in practice. As Palfrey\textsuperscript{53} explains, “[s]ometimes the law bans citizens from performing a particular activity online, such as accessing or publishing certain material. Sometimes the state takes control into its own hands by erecting technological or other barriers within the state’s confines to stop the flow of bits from one recipient to another. Increasingly however, the state is turning to private parties to carry out the online control. Often, those private parties are corporations chartered locally or individual citizens who live in that jurisdiction.” As Palfrey further explains, it is now commonly the case that the state “requires private parties – often intermediaries whose services connect one online actor to another – to participate in online censorship and surveillance as a cost of doing business in that state.”\textsuperscript{54}

The evolutionary trajectory of Internet filtering is evident, moving towards more and more sophisticated control mechanisms: from “open net” (from the Internet’s birth to 2000) through “access denied” (2000–2005), where crude filters and blocks were installed, towards “access controlled” (2005–2010), where mechanisms are multiple and varied, entering at different points of control to limit access to knowledge and information.\textsuperscript{55} Before long, we have entered a fourth phase of “access contested”, which is characterized by more diversified and

\textsuperscript{51} See updates at http://ec.europa.eu/trade/policy/in-focus/tpip/index_en.htm
\textsuperscript{54} Ibid.
deeper controls but also by a “pushback against some of these controls from civil society, supported in many instances by the resources of major governments, like the United States and the European Union.”

The repercussions of these “technologies of disconnection” are enormous for freedom of expression worldwide and put the democratizing potential of the Internet - the “technologies of freedom” - in doubt. The “Great Firewall of China” is the infamous example but we have also observed the developments of the Arab spring, which more dynamically show the battles over the Internet as a critical space for political action. The Snowden revelations have been the latest instance of exposing the breadth and depth of intervention and the use made by states with advanced democracies.

In contrast to conventional tools of regulating media, Internet filtering as a powerful method of exercising control is neither transparent, nor subject to mechanisms securing legitimacy and accountability. It is even different from standard surveillance methods, as applied by police enforcement, as Internet filtering is out of the judiciary control that may safeguard the rights of citizens from violations of privacy, freedom of speech or association. The trend of “outsourcing” the enforcement to private entities, often as a precondition for doing business, is particularly worrisome.

**Digital rights management systems**

Another mechanism to ensure perfect enforcement through technology is found in the so-called digital rights management systems (DRM). While Internet filtering is a practice that can be done in many diverse ways (partial or full sites shutdown, distributed denial of service, content filtering, cyber-attacks, etc.), DRM is a means that can be employed for different practices. DRM have mostly been discussed in the field of copyright enforcement, but they may be utilized for many other purposes as generic, embedded forms for controlling access and the use of digital content and devices.

Although DRM are plainly technical applications, they are problematic in the field of media policy as they may unduly restrict access to, and use of, digital content. This has firstly to do with the way copyright functions and secondly with the way DRM can automatically enforce it. As to the former, copyright and other types of IP protection are intended to foster innovation by granting authors a temporary monopoly over their creations. Copyright has built-in mechanisms, such as fair use, to ensure balance between the individual rights of the authors and the public interest. This balance becomes very fragile in the digital media environment, as companies seek perfect control over “their property” through DRM, under

---

62 See Deibert et al., “Fourth Phase”; Roberts et al., The Evolving Landscape.
the guise of protecting digital content from unlawful distribution and use. In practice, such efforts have eroded some fundamental rights of consumers and restricted usages traditionally allowed under analogue/offline copyright. In addition, DRM may in many situations deter the full realization of digital content production and distribution by rendering it illegal or simply by banning it - possibly severely chilling creativity.

In terms of regulation and its evolution, it must be stressed that the content industries have been very successful in their efforts to expand the scope and extend the duration of copyright. Through race-to-the-top strategies, this augmented protection has been emancipated to the international level in the framework of the TRIPS Agreement and in the even further-reaching free trade agreements (FTAs). Despite grassroots activism, IP issues have remained only marginal in key efforts aimed at securing public goods at the international level. For instance, they do not appear in any meaningful way in the 2005 UNESCO Convention on the Protection and Promotion of the Diversity of Cultural Expressions, nor do they figure in the World Summit on the Information Society (WSIS) agenda or in the recent NetMundial documents. At the same time, the circumvention of technical protection measures, such as DRM, has been prohibited in most jurisdictions, as well as internationally through the WIPO Internet Treaties. The proposed SOPA/PIPA legislation, which in essence aimed to expand the ability of US law enforcement to fight online trafficking, also beyond the US national jurisdiction, was one of the recent instances of desired expansion of state control. The anticipated dangers of silencing of speech and chilling innovation on the Internet, as well as the danger for the Internet itself, need to be clearly acknowledged.

72 Stop Online Piracy Act (SOPA), H.R. 3261 and Protect IP Act (Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property Act, or PIPA), S. 968. An essential difference between the two is that PIPA targets domain name system providers, financial companies and advertising networks, but not companies that provide Internet connectivity. After strong opposition by academics, corporations and civil society representatives (see e.g. “Sopa/Pipa: Internet Blacklist Legislation,” Electronic Frontier Foundation, accessed October 6, 2015, https://www.eff.org/issues/coica-internet-censorship-and-copyright-bill), both bills were dropped.
DRM have repercussions beyond copyright and its problematic interface with citizens’ rights. The DRM mechanisms are not transparent and, in fact, may allow for any type of interference, impacting on the privacy of the person reading an e-book, or watching a film on iTunes; they may deprive the individual from making choices between products or services or influence future commercial offers, turning (to put it symbolically) the user into a product. Ultimately, DRM-like systems can enforce any rule that content or device producers want, such as making access conditional on a payment. Such developments are aligned with the broader trend of the privatization of content rather than its democratization. Privileged access to scientific data and knowledge, entertainment, news and archives creates a deep divide, with various implications, between those who can afford to pay and those who cannot. In the discussions of net neutrality and search engines, one can also see elements of a creation of a two-tier environment, where in exchange for additional payment, one gets either faster access to data and traffic, or becomes more visible on the web. These different modalities are enabled by the different type of architecture in cyberspace.

Technology as regulation

The above cases fit into Lawrence Lessig’s broader narrative of “code is law.” Lessig argued that in cyberspace, code is overtaking the functions of law. In contrast to real-space, where architecture is more or less given, in cyberspace, it is “plastic” and open to change. Designing cyberspace through code thus becomes a very powerful regulatory activity. This code, which Lessig calls “West Coast Code” (because of the proximity to Silicon Valley), is starkly different from the “East Coast Code” (so-named because of the proximity to Washington, DC). The latter encompasses laws as a product of the conventional legislative processes, which in a democratic state involve highly formalized and complex mechanisms and are subject to a system of checks and balances. Traditional media law-making, both in terms of the rules and the institutions that are created, is precisely the product of such a deliberative process; these rules are also transparent and may be discussed, criticized, opposed and, perhaps, modified as a result. The US First Amendment case law, for instance, is strong proof of the practice of testing new media and the ways to regulate it against the high principle of freedom of speech.

“West Coast Code,” by contrast, is simply built into the hardware or the software; it is cheaper and faster to create but also opaque for citizens. In comparison to conventional law, it is also self-enforceable, without executive or judicial oversight. West Coast Code may well be an appropriate (and more economical) mechanism to address the pertinent specific and highly technical questions as it “industrializes” content surveillance, classification, and

management. But it lacks the legitimacy and accountability of conventional law-making. In addition, while such code can cater for some narrow policy goals, such as protecting against unlawful use of copyrighted works, it cannot address broader and much more complex objectives that involve a balance between different private and public interests.

The experience gained over the last 15 years, when the first edition of *Code and Other Laws of Cyberspace* was published, has confirmed Lessig’s theory and the move from law towards code in creating mechanisms of control in cyberspace. The situation has, in many aspects, only worsened. Indeed, we have seen the deterioration of some principles that initially allowed innovation over the network and have been enshrined in law. One such key principle existing in most telecommunication laws immunized the carriers, whether broadband companies or ISPs, for objectionable material that flows through their channels. This rule permitted media access by ordinary individuals and as Balkin argues, “… in terms of its practical effects, it may be even more important than many aspects of First Amendment doctrine”. The new generation of Information Society laws, such as the DMCA in the US and the Information Society Directive in the EU, limited the liability of ISPs for copyright infringements, asking them to react only *ex post*. Although the safe harbor rule as privately administered enforcement may have had some chilling effects on Internet speech, it may have had a positive impact too as it shielded intermediaries. Balkin believes that, “[w]ithout these safe harbor provisions, many features of current Internet practice – including the development of Web 2.0 applications that leverage the content contributions of many people—would be legally risky. Indeed, were it not for statutory safe harbors and other limits on copyright liability, the basic practices of search engines, and indeed much of the traffic on the Internet, might be illegal”.

Over time, however, some of these important foundational principles have deteriorated in practice. For example, most industrialized countries have severely limited safe harbors and reconsidered intermediaries’ responsibilities in copyright enforcement demanding their active involvement *ex ante* in order to escape liability. One can observe a shift from “passive-reactive to active-preventive schemes for communication intermediaries” and to a new type of content filtering enabled through the “deep packet inspection” technology, which may

---

90 ISPs taking care of traffic only were not responsible for copyright violations over their communication channels, as long as the ISPs terminated repeat infringers (17 USC § 512(a) (2000)). Intermediaries that hosted content had more responsibility, and were safe only if they acted swiftly to take down infringing material once they were notified of the infringement.
93 See Jeremy De Beer and Christopher D. Clemmer, “Global Trends in Online Copyright Enforcement: A Non-neutral Role for Network Intermediaries?,” The Journal of Law, Science and Technology 49 (2009): 375–409. further erode important users’ rights. The “right to be forgotten,” as recently formulated and endorsed by the Court of Justice of the European Union, puts an additional burden upon search engines to delist links to personal data upon request, in an effort to balance the right to privacy against the public’s right to access to information. While this interference may be justified for certain purposes, it is to be practiced with extreme caution, since even in seemingly technical decision-making, essential rights and values, such as freedom of expression, fairness, equality of opportunity and justice are affected.

Concluding remarks

In presenting the above trends, the paper’s prime aim was to illustrate that in the new media space there are multiple and increasing points of control outside formal legal institutions and outside the conventional scope of media policy. The complex and highly fragmented nature of governance, which often mobilizes intermediaries, threatens free speech and in general makes the pursuit of public objectives difficult.

On the one hand, we highlighted the importance of net neutrality as a principle that ensures that the flow of content is not controlled. We also stressed the increasing role of technologically-enabled control. We showed that it can effectively (and efficiently) influence the production and the flow of information, access to information, its consumption and reuse. Technology strongly influences both the interactions within the media environment that are to be regulated (that is, the subject of regulation), and its regulability (that is, the possibilities and conditions of regulation). Technological design can in itself “be more or less free speech friendly, and more or less participatory” – the current trends show the constraining rather than the enabling opportunities.

The perils of technologically-based regulation are all the greater if we bear in mind that there is still so much uncertainty as to the effects of the digital media environment on the intrinsic goals of media policy and how it affects the “ecology of freedom of expression.” This uncertainty is not fully acknowledged and regulators do not hesitate to intervene, mostly in the IP field but also in others, such as notably data protection. They often ignore the multidirectional effects of their action, having lost the caution and the lightness of touch of the early Internet days. The overall danger of unintended consequences is augmented by increased policy interdependence and the prevalent messy governance structures. In fact, digital media only accentuate globalness and interdependence, as local decisions have global impact and vice versa.

Recommendations for apt design for the regulation of internet content

---

97 See e.g. Keller, European and International Media Law; Burri, Public Service Broadcasting 3.0.
100 See Dutton et al., “Freedom,” 5.
Against the backdrop of the above analysis and despite its “bird’s eye” approach (or partly because of it), we would like to put forward a few recommendations that address issues critical for the evolving design of Internet content regulation.

While the freedom of expression, both as a passive and an active right, is protected under public international law,\textsuperscript{101} as earlier noted there are no commonly agreed international standards as to its implementation and state practice varies. At the same time, as the paper showed, the Internet both accentuates the importance of local decisions as well as enabling the state to mobilize newer forms of controlling content, in particular through intermediaries and technological design.

In this sense, while we do not envision a globally harmonized system of content regulation, we deem it crucial that at least two governance elements are addressed as a matter of global action – (i) constraining the practice of content filtering and (ii) commitment to the net neutrality principle.

With regard to the former, while it is important that Internet filtering is done as fairly as possible,\textsuperscript{102} as Mueller points out our underlying wish should not be to optimize filtering but rather to resist it.\textsuperscript{103} Whereas (as clarified at the paper’s outset) there are valid concerns that may justify state intervention, the nation state should exercise restraint in content policing and when necessary, base it on clear, transparent criteria and due process. The dangers of outsourcing content regulation to private actors and/or embedding it in code should be clearly acknowledged and the practice equally restrained.\textsuperscript{104} States should strive to rely on notice and takedown as an ex post method of addressing illegal content and do this exclusively within the parameters of their own jurisdiction – abstaining from extra-territorial action, which may interfere with the operation of the network.\textsuperscript{105} Furthermore, “[t]he governance of the Internet needs to explicitly recognize and embrace the principle that there are limits to national sovereignty over the flow of information. This claim is based on the truth that there are many transnational communities or policies, created by global electronic communications, whose individual members have their own intrinsic rights to communicate among themselves.”\textsuperscript{106}

With regard to net neutrality, while there is increasingly an acknowledgement of its centrality as an architectural foundation and its impact on innovation and the free flow of content, the international community has not done much. It could, for instance, reach consensus on the principle and enshrine it in the NetMundial Multistakeholder Documents.\textsuperscript{107} So, the international community and civil society too should strive to enshrine this principle, as broadly conceived,\textsuperscript{108} as a global norm, at least in a soft law form. A network that is neutral has so far permitted an incredible amount of creativity and innovation and does, in effect, eliminate gatekeepers and diverse barriers to access: “A neutral network maximizes access to the public and minimizes the ability of an intermediary to substitute its own judgments for those of end users.”\textsuperscript{109} States should not only rhetorically commit to net neutrality but

\textsuperscript{101} Art. 19 of the Universal Declaration of Human Rights; art. 19 of the International Covenant on Civil and Political Rights, as well as art. 10 of the European Convention for the Protection of Human Rights and Fundamental Freedoms.

implement it in effect, as the US did. They should also try to *mainstream* it and this may affect a number of policies and overall regulatory design, such as those elaborated in multilateral and regional trade venues, which at first sight appear less directly linked to content regulation.\(^{110}\)

Overall, states should strive to adhere to the deferential principle of respecting the functional integrity of the Internet and combine this with appropriate institutional and organizational implements, which can ultimately “help ensure that any potential regulation of Internet-based activities enables, rather than hinders, tangible and intangible benefits for end users.”\(^{111}\) To be sure, the design of this distributed governance architecture in a “shared environment”\(^{112}\) is hard to pinpoint and there is a need for more research that maps existing models in different regimes seeking apt solutions, as well as mapping power relations in different institutional settings, which are ultimately important for the feasibility of any proposed design. Finally, while states grapple with formulating their coherent roles in the broad Internet governance landscape, they should subscribe to the “do no harm” principle. In this sense, policy-makers should not adopt regulations that violate the Internet’s modular, end-to-end, interconnected and agnostic nature and give way to the comparative wisdom and efficacy of polycentric processes and outcomes.\(^{113}\)
